3.12: Closure Properties of Regular Languages

In this section, we show how to convert regular expressions to finite automata, as well as how to convert finite automata to regular expressions.

3.12: Closure Properties of Regular Languages

In this section, we show how to convert regular expressions to finite automata, as well as how to convert finite automata to regular expressions.

As a result, we will be able to conclude that the following statements about a language L are equivalent:

- L is regular;
- L is generated by a regular expression;
- L is accepted by a finite automaton;
- L is accepted by an EFA;
- L is accepted by an NFA; and
- L is accepted by a DFA.

Introduction

Also, we will introduce:

- operations on FAs corresponding to union, concatenation and closure;
- an operation on EFAs corresponding to intersection; and
- an operation on DFAs corresponding to set difference.

Introduction

Also, we will introduce:

- operations on FAs corresponding to union, concatenation and closure;
- an operation on EFAs corresponding to intersection; and
- an operation on DFAs corresponding to set difference.

As a result, we will have that the set **RegLan** of regular languages is closed under union, concatenation, closure, intersection and set difference. I.e., we will have that, if $L, L_1, L_2 \in \mathbf{RegLan}$, then $L_1 \cup L_2$, L_1L_2 , L^* , $L_1 \cap L_2$ and $L_1 - L_2$ are in **RegLan**.

Introduction

Also, we will introduce:

- operations on FAs corresponding to union, concatenation and closure;
- an operation on EFAs corresponding to intersection; and
- an operation on DFAs corresponding to set difference.

As a result, we will have that the set **RegLan** of regular languages is closed under union, concatenation, closure, intersection and set difference. I.e., we will have that, if $L, L_1, L_2 \in \mathbf{RegLan}$, then $L_1 \cup L_2$, L_1L_2 , L^* , $L_1 \cap L_2$ and $L_1 - L_2$ are in **RegLan**.

The book shows several additional closure properties of regular languages.

Operations on FAs

We write **emptyStr** for the DFA

and emptySet for the DFA

Thus, we have that $L(\mathbf{emptyStr}) = \{\%\}$ and $L(\mathbf{emptySet}) = \emptyset$. Of course $\mathbf{emptyStr}$ and $\mathbf{emptySet}$ are also NFAs, EFAs and FAs.

Operations on FAs

We write **emptyStr** for the DFA

and emptySet for the DFA

Thus, we have that $L(\mathbf{emptyStr}) = \{\%\}$ and $L(\mathbf{emptySet}) = \emptyset$. Of course $\mathbf{emptyStr}$ and $\mathbf{emptySet}$ are also NFAs, EFAs and FAs.

Operations on FAs

We write **emptyStr** for the DFA

and emptySet for the DFA

Thus, we have that $L(emptyStr) = \{\%\}$ and $L(emptySet) = \emptyset$. Of course emptyStr and emptySet are also NFAs, EFAs and FAs.

Functions for Building Simple FAs

Next, we define a function $\mathbf{strToFA} \in \mathbf{Str} \to \mathbf{FA}$ by: $\mathbf{strToFA} \times$ is the FA

Thus, for all $x \in \mathbf{Str}$, $L(\mathbf{strToFA} x) = \{x\}$.

Functions for Building Simple FAs

Next, we define a function $\mathbf{strToFA} \in \mathbf{Str} \to \mathbf{FA}$ by: $\mathbf{strToFA} \times$ is the FA

Thus, for all $x \in \mathbf{Str}$, $L(\mathbf{strToFA} x) = \{x\}$.

Functions for Building Simple FAs

Next, we define a function $\mathbf{strToFA} \in \mathbf{Str} \to \mathbf{FA}$ by: $\mathbf{strToFA} \times$ is the FA

Thus, for all $x \in \mathsf{Str}$, $L(\mathsf{strToFA}\,x) = \{x\}$. It is also convenient to define a function $\mathsf{symToNFA} \in \mathsf{Sym} \to \mathsf{NFA}$ by: $\mathsf{symToNFA}\,a = \mathsf{strToFA}\,a$. Of course, $\mathsf{symToNFA}$ is also an element of $\mathsf{Sym} \to \mathsf{EFA}$ and $\mathsf{Sym} \to \mathsf{FA}$. Furthermore, for all $a \in \mathsf{Sym}$, $L(\mathsf{symToNFA}\,a) = \{a\}$.

- \bullet $Q_N =$
- *s*_N =
- \bullet $A_N =$
- *T_N* =

- $Q_N = \{A\} \cup \{\langle 1, q \rangle \mid q \in Q_{M_1}\} \cup \{\langle 2, q \rangle \mid q \in Q_{M_2}\};$
- *s*_N =
- \bullet $A_N =$
- *T*_N =

Next, we define a function/algorithm $union \in FA \times FA \rightarrow FA$ such that $L(union(M_1, M_2)) = L(M_1) \cup L(M_2)$, for all $M_1, M_2 \in FA$. If $M_1, M_2 \in FA$, then $union(M_1, M_2)$ is the FA N such that:

- $Q_N = \{A\} \cup \{\langle 1, q \rangle \mid q \in Q_{M_1}\} \cup \{\langle 2, q \rangle \mid q \in Q_{M_2}\};$
- $s_N = A$;
- \bullet $A_N =$
- $T_N =$

Next, we define a function/algorithm $union \in FA \times FA \rightarrow FA$ such that $L(union(M_1, M_2)) = L(M_1) \cup L(M_2)$, for all $M_1, M_2 \in FA$. If $M_1, M_2 \in FA$, then $union(M_1, M_2)$ is the FA N such that:

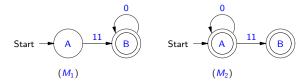

- $Q_N = \{A\} \cup \{\langle 1, q \rangle \mid q \in Q_{M_1}\} \cup \{\langle 2, q \rangle \mid q \in Q_{M_2}\};$
- $s_N = A$;
- $A_N = \{ \langle 1, q \rangle \mid q \in A_{M_1} \} \cup \{ \langle 2, q \rangle \mid q \in A_{M_2} \};$ and
- $T_N =$

- $Q_N = \{A\} \cup \{\langle 1, q \rangle \mid q \in Q_{M_1}\} \cup \{\langle 2, q \rangle \mid q \in Q_{M_2}\};$
- $s_N = A$;
- $A_N = \{ \langle 1, q \rangle \mid q \in A_{M_1} \} \cup \{ \langle 2, q \rangle \mid q \in A_{M_2} \};$ and
- \bullet $T_N =$

$$\begin{aligned} & \{\mathsf{A}, \% \to \langle 1, s_{\mathsf{M}_1} \rangle \} \\ & \cup \{\mathsf{A}, \% \to \langle 2, s_{\mathsf{M}_2} \rangle \} \\ & \cup \{ \langle 1, q \rangle, \mathsf{a} \to \langle 1, r \rangle \mid q, \mathsf{a} \to r \in T_{\mathsf{M}_1} \} \\ & \cup \{ \langle 2, q \rangle, \mathsf{a} \to \langle 2, r \rangle \mid q, \mathsf{a} \to r \in T_{\mathsf{M}_2} \}. \end{aligned}$$

Union Example

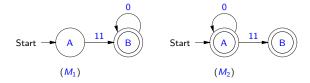

For example, if M_1 and M_2 are the FAs

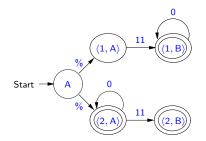

then $union(M_1, M_2)$ is the FA

Union Example

For example, if M_1 and M_2 are the FAs

then $union(M_1, M_2)$ is the FA

Union

Proposition 3.12.1

For all $M_1, M_2 \in \mathbf{FA}$:

- $L(\mathbf{union}(M_1, M_2)) = L(M_1) \cup L(M_2)$; and
- alphabet(union(M_1, M_2)) = alphabet $M_1 \cup$ alphabet M_2 .

Proposition 3.12.2

For all $M_1, M_2 \in \mathbf{EFA}$, union $(M_1, M_2) \in \mathbf{EFA}$.

- \bullet $Q_N =$
- *s*_N =
- \bullet $A_N =$
- $T_N =$

- $Q_N = \{ \langle 1, q \rangle \mid q \in Q_{M_1} \} \cup \{ \langle 2, q \rangle \mid q \in Q_{M_2} \};$
- *s*_N =
- \bullet $A_N =$
- $T_N =$

- $Q_N = \{ \langle 1, q \rangle \mid q \in Q_{M_1} \} \cup \{ \langle 2, q \rangle \mid q \in Q_{M_2} \};$
- $s_N = \langle 1, s_{M_1} \rangle$;
- *A*_N =
- $T_N =$

- $Q_N = \{ \langle 1, q \rangle \mid q \in Q_{M_1} \} \cup \{ \langle 2, q \rangle \mid q \in Q_{M_2} \};$
- $s_N = \langle 1, s_{M_1} \rangle$;
- $A_N = \{ \langle 2, q \rangle \mid q \in A_{M_2} \}$; and
- $T_N =$

- $Q_N = \{ \langle 1, q \rangle \mid q \in Q_{M_1} \} \cup \{ \langle 2, q \rangle \mid q \in Q_{M_2} \};$
- $s_N = \langle 1, s_{M_1} \rangle$;
- $A_N = \{ \langle 2, q \rangle \mid q \in A_{M_2} \}$; and
- \bullet $T_N =$

$$\{ \langle 1, q \rangle, \% \rightarrow \langle 2, s_{M_2} \rangle \mid q \in A_{M_1} \}$$

$$\cup \{ \langle 1, q \rangle, a \rightarrow \langle 1, r \rangle \mid q, a \rightarrow r \in T_{M_1} \}$$

$$\cup \{ \langle 2, q \rangle, a \rightarrow \langle 2, r \rangle \mid q, a \rightarrow r \in T_{M_2} \}.$$

Concatenation Example

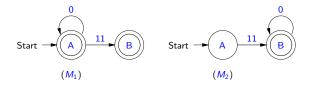

For example, if M_1 and M_2 are the FAs

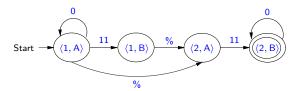

then $concat(M_1, M_2)$ is the FA

Concatenation Example

For example, if M_1 and M_2 are the FAs

then $concat(M_1, M_2)$ is the FA

Concatenation

Proposition 3.12.3

For all $M_1, M_2 \in \mathbf{FA}$:

- $L(\mathbf{concat}(M_1, M_2)) = L(M_1)L(M_2)$; and
- alphabet(concat(M_1, M_2)) = alphabet $M_1 \cup$ alphabet M_2 .

Proposition 3.12.4

For all $M_1, M_2 \in \mathsf{EFA}$, $\mathsf{concat}(M_1, M_2) \in \mathsf{EFA}$.

- \bullet $Q_N =$
- *s*_N =
- \bullet $A_N =$
- *T_N* =

- $Q_N = \{A\} \cup \{\langle q \rangle \mid q \in Q_M\};$
- *s*_N =
- \bullet $A_N =$
- *T*_N =

- $Q_N = \{A\} \cup \{\langle q \rangle \mid q \in Q_M\};$
- $s_N = A$;
- \bullet $A_N =$
- $T_N =$

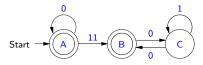

- $Q_N = \{A\} \cup \{\langle q \rangle \mid q \in Q_M\};$
- $s_N = A$;
- $A_N = \{A\}$; and
- $T_N =$

- $Q_N = \{A\} \cup \{\langle q \rangle \mid q \in Q_M\};$
- $s_N = A$;
- $A_N = \{A\}$; and
- $T_N =$

$$\begin{aligned} & \{\mathsf{A}, \% \to \langle \mathsf{s}_\mathsf{M} \rangle \} \\ & \cup \{ \langle q \rangle, \% \to \mathsf{A} \mid q \in A_\mathsf{M} \} \\ & \cup \{ \langle q \rangle, \mathsf{a} \to \langle r \rangle \mid q, \mathsf{a} \to r \in T_\mathsf{M} \}. \end{aligned}$$

Closure Example

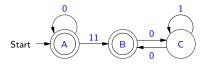

For example, if M is the FA

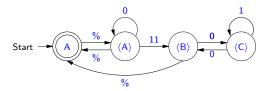

then **closure** *M* is the FA

Closure Example

For example, if M is the FA

then **closure** *M* is the FA

Closure

Proposition 3.12.5

For all $M \in \mathbf{FA}$,

- L(closure $M) = L(M)^*$; and
- alphabet(closure M) = alphabet M.

Proposition 3.12.6

For all $M \in \mathbf{EFA}$, closure $M \in \mathbf{EFA}$.

Conversion Algorithm

We define a function/algorithm $\operatorname{regToFA} \in \operatorname{Reg} \to \operatorname{FA}$ by well-founded recursion on the height of regular expressions, as follows. The goal is for $L(\operatorname{regToFA}\alpha)$ to be equal to $L(\alpha)$, for all regular expressions α .

- regToFA % =
- regToFA\$ =
- for all $\alpha \in \mathbf{Reg}$, $\mathbf{regToFA}(\alpha^*) =$
- for all $\alpha, \beta \in \mathbf{Reg}$, $\mathbf{regToFA}(\alpha + \beta) =$

- regToFA % = emptyStr;
- regToFA\$ =
- for all $\alpha \in \mathbf{Reg}$, $\mathbf{regToFA}(\alpha^*) =$
- for all $\alpha, \beta \in \mathbf{Reg}$, $\mathbf{regToFA}(\alpha + \beta) =$

- regToFA % = emptyStr;
- regToFA \$ = emptySet;
- for all $\alpha \in \mathbf{Reg}$, $\mathbf{regToFA}(\alpha^*) =$
- for all $\alpha, \beta \in \mathbf{Reg}$, $\mathbf{regToFA}(\alpha + \beta) =$

- regToFA % = emptyStr;
- regToFA \$ = emptySet;
- for all $\alpha \in \text{Reg}$, $\text{regToFA}(\alpha^*) = \text{closure}(\text{regToFA} \alpha)$;
- for all $\alpha, \beta \in \mathbf{Reg}$, $\mathbf{regToFA}(\alpha + \beta) =$

- regToFA % = emptyStr;
- regToFA \$ = emptySet;
- for all $\alpha \in \text{Reg}$, $\text{regToFA}(\alpha^*) = \text{closure}(\text{regToFA} \alpha)$;
- for all $\alpha, \beta \in \text{Reg}$, regToFA $(\alpha + \beta) = \text{union}(\text{regToFA} \alpha, \text{regToFA} \beta)$;

- for all $n \in \mathbb{N} \{0\}$ and $a_1, \ldots, a_n \in \mathbf{Sym}$, $\mathbf{regToFA}(a_1 \cdots a_n) =$
- for all $n \in \mathbb{N} \{0\}$, $a_1, \ldots, a_n \in \mathbf{Sym}$ and $\alpha \in \mathbf{Reg}$, if α doesn't consist of a single symbol, and doesn't have the form $b \beta$ for some $b \in \mathbf{Sym}$ and $\beta \in \mathbf{Reg}$, then $\mathbf{regToFA}(a_1 \cdots a_n \alpha) =$
- for all $\alpha, \beta \in \mathbf{Reg}$, if α doesn't consist of a single symbol, then $\mathbf{regToFA}(\alpha\beta) =$

For example, we have that $\mathbf{regToFA}(0101^*) =$

- for all $n \in \mathbb{N} \{0\}$ and $a_1, \ldots, a_n \in \mathbf{Sym}$, $\mathbf{regToFA}(a_1 \cdots a_n) = \mathbf{strToFA}(a_1 \cdots a_n)$;
- for all $n \in \mathbb{N} \{0\}$, $a_1, \ldots, a_n \in \mathbf{Sym}$ and $\alpha \in \mathbf{Reg}$, if α doesn't consist of a single symbol, and doesn't have the form $b \beta$ for some $b \in \mathbf{Sym}$ and $\beta \in \mathbf{Reg}$, then $\mathbf{regToFA}(a_1 \cdots a_n \alpha) =$
- for all $\alpha, \beta \in \mathbf{Reg}$, if α doesn't consist of a single symbol, then $\mathbf{regToFA}(\alpha\beta) =$

For example, we have that $\mathbf{regToFA}(0101^*) =$

- for all $n \in \mathbb{N} \{0\}$ and $a_1, \ldots, a_n \in \mathbf{Sym}$, $\mathbf{regToFA}(a_1 \cdots a_n) = \mathbf{strToFA}(a_1 \cdots a_n)$;
- for all $n \in \mathbb{N} \{0\}$, $a_1, \ldots, a_n \in \mathbf{Sym}$ and $\alpha \in \mathbf{Reg}$, if α doesn't consist of a single symbol, and doesn't have the form $b \beta$ for some $b \in \mathbf{Sym}$ and $\beta \in \mathbf{Reg}$, then $\mathbf{regToFA}(a_1 \cdots a_n \alpha) = \mathbf{concat}(\mathbf{strToFA}(a_1 \cdots a_n), \mathbf{regToFA} \alpha)$; and
- for all $\alpha, \beta \in \mathbf{Reg}$, if α doesn't consist of a single symbol, then $\mathbf{regToFA}(\alpha\beta) =$

For example, we have that $regToFA(0101^*) =$

- for all $n \in \mathbb{N} \{0\}$ and $a_1, \ldots, a_n \in \mathbf{Sym}$, $\mathbf{regToFA}(a_1 \cdots a_n) = \mathbf{strToFA}(a_1 \cdots a_n)$;
- for all $n \in \mathbb{N} \{0\}$, $a_1, \ldots, a_n \in \mathbf{Sym}$ and $\alpha \in \mathbf{Reg}$, if α doesn't consist of a single symbol, and doesn't have the form $b \beta$ for some $b \in \mathbf{Sym}$ and $\beta \in \mathbf{Reg}$, then $\mathbf{regToFA}(a_1 \cdots a_n \alpha) = \mathbf{concat}(\mathbf{strToFA}(a_1 \cdots a_n), \mathbf{regToFA} \alpha)$; and
- for all $\alpha, \beta \in \mathbf{Reg}$, if α doesn't consist of a single symbol, then $\mathbf{regToFA}(\alpha\beta) = \mathbf{concat}(\mathbf{regToFA} \alpha, \mathbf{regToFA} \beta)$.

For example, we have that $\mathbf{regToFA}(0101^*) =$

- for all $n \in \mathbb{N} \{0\}$ and $a_1, \ldots, a_n \in \mathbf{Sym}$, $\mathbf{regToFA}(a_1 \cdots a_n) = \mathbf{strToFA}(a_1 \cdots a_n)$;
- for all $n \in \mathbb{N} \{0\}$, $a_1, \ldots, a_n \in \mathbf{Sym}$ and $\alpha \in \mathbf{Reg}$, if α doesn't consist of a single symbol, and doesn't have the form $b \beta$ for some $b \in \mathbf{Sym}$ and $\beta \in \mathbf{Reg}$, then $\mathbf{regToFA}(a_1 \cdots a_n \alpha) = \mathbf{concat}(\mathbf{strToFA}(a_1 \cdots a_n), \mathbf{regToFA} \alpha)$; and
- for all $\alpha, \beta \in \mathbf{Reg}$, if α doesn't consist of a single symbol, then $\mathbf{regToFA}(\alpha\beta) = \mathbf{concat}(\mathbf{regToFA} \alpha, \mathbf{regToFA} \beta)$.

For example, we have that $\mathbf{regToFA}(0101^*) = \mathbf{concat}(\mathbf{strToFA}(010), \mathbf{regToFA}(1^*)).$

Specification of regToFA

Theorem 3.12.7

For all $\alpha \in \mathbf{Reg}$:

- $L(\operatorname{regToFA} \alpha) = L(\alpha)$; and
- alphabet(regToFA α) = alphabet α .

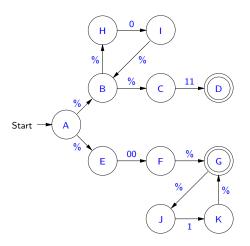

Proof. Because of the form of recursion used, the proof uses well-founded induction on the height of α . \square

Example Conversion

For example, regToFA(0*11 + 001*) is isomorphic to the FA

Example Conversion

For example, regToFA(0*11+001*) is isomorphic to the FA

Building FAs in Forlan

The Forlan module FA includes these constants and functions for building finite automata and converting regular expressions to finite automata:

```
val emptyStr : fa
val emptySet : fa
val fromStr : str -> fa
val fromSym : sym -> fa
val union : fa * fa -> fa
val concat : fa * fa -> fa
val closure : fa -> fa
val fromReg : reg -> fa
```

The functions fromStr and fromSym correspond to strToFA and symToNFA, and are also available in the top-level environment with the names

```
val strToFA : str -> fa
val symToFA : sym -> fa
```

Building FAs in Forlan

The function fromReg corresponds to regToFA and is available in the top-level environment with that name:

```
val regToFA : reg -> fa
```

The constants emptyStr and emptySet are inherited by the modules DFA, NFA and EFA.

The function fromSym is inherited by the modules NFA and EFA, and is available in the top-level environment with the names

```
val symToNFA : sym -> nfa
val symToEFA : sym -> efa
```

The functions union, concat and closure are inherited by the module EFA.

Forlan Example

Here is how the regular expression $0^*11 + 001^*$ can be converted to an FA in Forlan:

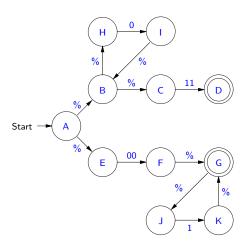

```
- val reg = Reg.input "";
@ 0*11 + 001*
@ .
val reg = - : reg
- val fa = regToFA reg;
val fa = - : fa
- val fa' = FA.renameStatesCanonically fa;
val fa' = - : fa
```

Forlan Example

```
- FA.output("", fa');
{states} A, B, C, D, E, F, G, H, I, J, K
{start state} A {accepting states} D, G
{transitions}
A, % -> B | E; B, % -> C | H; C, 11 -> D; E, 00 -> F;
F, % -> G; G, % -> J; H, 0 -> I; I, % -> B; J, 1 -> K;
K, % -> G
val it = (): unit
```

Forlan Example

Thus fa' is the finite automaton

Converting FAs to Regular Expressions

Our algorithm for converting FAs to regular expressions makes use of a more general kind of finite automata that we call regular expression finite automata.

Regular Expression Finite Automata

A regular expression finite automaton (RFA) M consists of:

- a finite set Q_M of symbols;
- an element s_M of Q_M ;
- a subset A_M of Q_M ; and
- a finite subset T_M of $\{(q, r) | q, r \in Q_M \text{ and } \in \}$

We write **RFA** for the set of all RFAs, which is a countably infinite set.

RFAs are drawn analogously to FAs, and the Forlan syntax for RFAs is analogous to that of FAs.

Regular Expression Finite Automata

A regular expression finite automaton (RFA) M consists of:

- a finite set Q_M of symbols;
- an element s_M of Q_M ;
- a subset A_M of Q_M ; and
- a finite subset T_M of $\{(q, \alpha, r) \mid q, r \in Q_M \text{ and } \alpha \in \mathbf{Reg}\}$

We write **RFA** for the set of all RFAs, which is a countably infinite set.

RFAs are drawn analogously to FAs, and the Forlan syntax for RFAs is analogous to that of FAs.

Regular Expression Finite Automata

A regular expression finite automaton (RFA) M consists of:

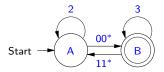

- a finite set Q_M of symbols;
- an element s_M of Q_M;
- a subset A_M of Q_M ; and
- a finite subset T_M of $\{(q, \alpha, r) \mid q, r \in Q_M \text{ and } \alpha \in \mathbf{Reg}\}$ such that, for all $q, r \in Q_M$, there is at most one $\alpha \in \mathbf{Reg}$ such that $(q, \alpha, r) \in T_M$.

We write **RFA** for the set of all RFAs, which is a countably infinite set.

RFAs are drawn analogously to FAs, and the Forlan syntax for RFAs is analogous to that of FAs.

RFAs

For example, the RFA M whose states are A and B, start state is A, only accepting state is B, and transitions are (A, 2, A), $(A, 00^*, B)$, (B, 3, B) and $(B, 11^*, A)$ can be drawn as

and expressed in Forlan as

```
{states} A, B {start state} A {accepting states} B {transitions} A, 2 \rightarrow A; A, 00* \rightarrow B; B, 3 \rightarrow B; B, 11* \rightarrow A
```

More on RFAs

The alphabet of an RFA M (alphabet M) is $\{a \in \mathbf{Sym} \mid \text{ there are } q, \alpha, r \text{ such that } q, \alpha \to r \in T_M \text{ and } a \in \mathbf{alphabet} \ \alpha \}.$

For example, the alphabet of our example FA M is $\{0, 1, 2, 3\}$.

More on RFAs

The alphabet of an RFA M (alphabet M) is $\{a \in \text{Sym} \mid \text{ there are } q, \alpha, r \text{ such that } q, \alpha \rightarrow r \in T_M \text{ and } a \in \text{alphabet } \alpha \}$.

For example, the alphabet of our example FA M is $\{0, 1, 2, 3\}$.

The Forlan module RFA defines an abstract type rfa (in the top-level environment) of regular expression finite automata, as well as some functions for processing RFAs including:

Graphical Editor for RFAs

The Java program JForlan, can be used to view and edit regular expression finite automata. It can be invoked directly, or run via Forlan. See the Forlan website for more information.

Validity of Labeled Paths in RFAs

A labeled path

$$q_1 \stackrel{x_1}{\Rightarrow} q_2 \stackrel{x_2}{\Rightarrow} \cdots q_n \stackrel{x_n}{\Rightarrow} q_{n+1},$$

is valid for an RFA M iff, for all $i \in [1:n]$,

$$x_i \in L(\alpha)$$
, for some $\alpha \in \mathbf{Reg}$ such that $q_i, \alpha \to q_{i+1}$,

and $q_{n+1} \in Q_M$.

Validity of Labeled Paths in RFAs

A labeled path

$$q_1 \stackrel{x_1}{\Rightarrow} q_2 \stackrel{x_2}{\Rightarrow} \cdots q_n \stackrel{x_n}{\Rightarrow} q_{n+1},$$

is valid for an RFA M iff, for all $i \in [1:n]$,

$$x_i \in L(\alpha)$$
, for some $\alpha \in \mathbf{Reg}$ such that $q_i, \alpha \to q_{i+1}$,

and $q_{n+1} \in Q_M$.

For example, the labeled path

$$A\overset{000}{\Rightarrow}B\overset{3}{\Rightarrow}B$$

is valid for our example FA M, because

- $000 \in L(00^*)$ and $A, 00^* \to B \in T$, and
- $3 \in L(3)$ and $B, 3 \rightarrow B \in T$.

The Meaning of RFAs

A string w is accepted by an RFA M iff there is a labeled path lp such that

- the label of lp is w;
- *lp* is valid for *M*;
- the start state of *Ip* is the start state of *M*; and
- the end state of *lp* is an accepting state of *M*.

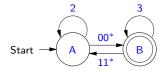

We have that, if w is accepted by M, then alphabet $w \subseteq$ alphabet M.

The language accepted by an RFA M(L(M)) is

```
\{ w \in \mathbf{Str} \mid w \text{ is accepted by } M \}.
```

RFA Meaning Example

Consider our example RFA M:

We have that 20 and 0000111103 are accepted by M, but that 23 and 122 are not accepted by M.

A Function for Combining Transitions

We define a function **combineTrans** that takes in a pair (simp, U) such that

- $simp \in \mathbf{Reg} \to \mathbf{Reg}$ and
- U is a finite subset of $\{p, \alpha \to q \mid p, q \in \mathbf{Sym} \text{ and } \alpha \in \mathbf{Reg} \}$, and returns a finite subset V of $\{p, \alpha \to q \mid p, q \in \mathbf{Sym} \text{ and } \alpha \in \mathbf{Reg} \}$ with the property that, for all $p, q \in \mathbf{Sym}$, there is at most one β such that $p, \beta \to q \in V$.

A Function for Combining Transitions

We define a function **combineTrans** that takes in a pair (simp, U) such that

- $simp \in \mathbf{Reg} \to \mathbf{Reg}$ and
- U is a finite subset of $\{p, \alpha \to q \mid p, q \in \mathbf{Sym} \text{ and } \alpha \in \mathbf{Reg} \}$, and returns a finite subset V of $\{p, \alpha \to q \mid p, q \in \mathbf{Sym} \text{ and } \alpha \in \mathbf{Reg} \}$ with the property that, for all $p, q \in \mathbf{Sym}$, there is at most one β such that $p, \beta \to q \in V$.

Given such a pair (simp, U), **combineTrans** returns the set of all transitions $p, \alpha \to q$ such that $\{\beta \mid p, \beta \to q \in U\}$ is nonempty, and $\alpha = simp(\beta_1 + \dots + \beta_n)$, where β_1, \dots, β_n are all of the elements of this set, listed in increasing order and without repetition.

Converting FAs to RFAs

We define a function/algorithm

$$\textbf{faToRFA} \in (\textbf{Reg} \rightarrow \textbf{Reg}) \rightarrow \textbf{FA} \rightarrow \textbf{RFA}.$$

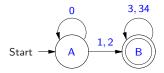

faToRFA takes in $simp \in \mathbf{Reg} \to \mathbf{Reg}$, and returns a function that takes in $M \in \mathbf{FA}$, and returns the RFA N such that:

- $Q_N = Q_M$;
- $s_N = s_M$;
- $A_N = A_M$: and
- \bullet $T_N =$

combineTrans(simp, { p, $strToReg x \rightarrow q \mid p, x \rightarrow q \in T_M$ }).

FA to RFA Example

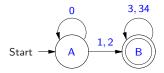

For example, if the FA M is

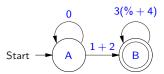

and the simplification function simp is locallySimplify obviousSubset then faToRFA $simp\ M$ is the RFA

FA to RFA Example

For example, if the FA M is

and the simplification function simp is locallySimplify obviousSubset then faToRFA $simp\ M$ is the RFA

Specification of faToRFA

Proposition 3.12.8

Suppose $simp \in \mathbf{Reg} \to \mathbf{Reg}$ and $M \in \mathbf{FA}$. If, for all $\alpha \in \mathbf{Reg}$, $L(simp \alpha) = L(\alpha)$ and $\mathbf{alphabet}(simp \alpha) \subseteq \mathbf{alphabet}(\alpha)$, then

- (1) L(faToRFA simp M) = L(M), and
- (2) alphabet(faToRFA simp M) = alphabet M.

Converting FAs to RFAs in Forlan

The RFA module has a function

```
val fromRFA : (reg \rightarrow reg) \rightarrow fa \rightarrow rfa that corresponds to faToRFA.
```

Converting FAs to RFAs in Forlan

Here is how our conversion example can be carried out in Forlan:

Converting FAs to RFAs in Forlan

```
- val rfa = RFA.fromFA simp fa;
val rfa = - : rfa
- RFA.output("", rfa);
{states} A, B {start state} A {accepting states} B
{transitions}
A, 0 -> A; A, 1 + 2 -> B; B, 3(% + 4) -> B
val it = () : unit
```

We say that an RFA *M* is *standard* iff

- M's start state is not an accepting state, and there are no transitions into M's start state (even from s_M to itself); and
- *M* has a single accepting state, and there are no transitions from that state (even from the accepting state to itself).

We say that an RFA *M* is *standard* iff

- M's start state is not an accepting state, and there are no transitions into M's start state (even from s_M to itself); and
- M has a single accepting state, and there are no transitions from that state (even from the accepting state to itself).

Proposition 3.12.9

Suppose M is a standard RFA with only two states, and that q is M's accepting state.

- For all $\alpha \in \mathbf{Reg}$, if $s_M, \alpha \to q$, then L(M) =
- If there is no $\alpha \in \mathbf{Reg}$ such that $s_M, \alpha \to q$, then L(M) =

We say that an RFA M is standard iff

- M's start state is not an accepting state, and there are no transitions into M's start state (even from s_M to itself); and
- M has a single accepting state, and there are no transitions from that state (even from the accepting state to itself).

Proposition 3.12.9

Suppose M is a standard RFA with only two states, and that q is M's accepting state.

- For all $\alpha \in \text{Reg}$, if $s_M, \alpha \to q$, then $L(M) = L(\alpha)$.
- If there is no $\alpha \in \mathbf{Reg}$ such that $s_M, \alpha \to q$, then L(M) =

We say that an RFA M is standard iff

- M's start state is not an accepting state, and there are no transitions into M's start state (even from s_M to itself); and
- *M* has a single accepting state, and there are no transitions from that state (even from the accepting state to itself).

Proposition 3.12.9

Suppose M is a standard RFA with only two states, and that q is M's accepting state.

- For all $\alpha \in \text{Reg}$, if $s_M, \alpha \to q$, then $L(M) = L(\alpha)$.
- If there is no $\alpha \in \mathbf{Reg}$ such that $s_M, \alpha \to q$, then $L(M) = \emptyset$.

Standardization

We define a function **standardize** \in **RFA** \rightarrow **RFA** that standardizes an RFA, as follows. Given an argument M, it returns the RFA N such that:

- $Q_N = \{ \langle q \rangle \mid q \in Q_M \} \cup \{A, B\};$ • $s_N = A;$
- $A_N = \{B\}$; and
- T_N

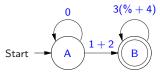

$$= \{A, \% \to \langle s_M \rangle \}$$

$$\cup \ \{ \langle q \rangle, \% \to B \mid q \in A_M \}$$

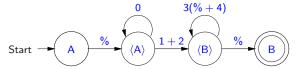

$$\cup \ \{ \langle q \rangle, \alpha \to \langle r \rangle \mid q, \alpha \to r \in T_M \}.$$

Standardization

For example, if M is the RFA

then **standardize** M is the RFA

Proposition 3.12.10

Suppose M is an RFA. Then:

- **standardize** *M* is standard;
- L(standardize M) = L(M); and
- alphabet(standardize M) = alphabet M.

Eliminating a State of an RFA

Next, we define a function **eliminateState** that takes in a function $simp \in \mathbf{Reg} \to \mathbf{Reg}$, and returns a function that takes in a pair (M,q), where M is an RFA and $q \in Q_M - (\{s_M\} \cup A_M)$, and then returns an RFA. When called with such a simp and (M,q), **eliminateState** returns the RFA N such that:

- $Q_N = Q_M \{q\};$
- $s_N = s_M$;
- $A_N = A_M$; and

Eliminating a State of an RFA

Next, we define a function **eliminateState** that takes in a function $simp \in \mathbf{Reg} \to \mathbf{Reg}$, and returns a function that takes in a pair (M,q), where M is an RFA and $q \in Q_M - (\{s_M\} \cup A_M)$, and then returns an RFA. When called with such a simp and (M,q), **eliminateState** returns the RFA N such that:

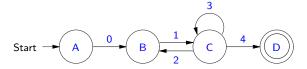

- $Q_N = Q_M \{q\};$
- $s_N = s_M$;
- $A_N = A_M$; and
- $T_N = \mathbf{combineTrans}(simp, U \cup V)$, where
 - $U = \{ p, \alpha \rightarrow r \in T_M \mid p \neq q \text{ and } r \neq q \}$,

Eliminating a State of an RFA

Next, we define a function **eliminateState** that takes in a function $simp \in \mathbf{Reg} \to \mathbf{Reg}$, and returns a function that takes in a pair (M,q), where M is an RFA and $q \in Q_M - (\{s_M\} \cup A_M)$, and then returns an RFA. When called with such a simp and (M,q), **eliminateState** returns the RFA N such that:

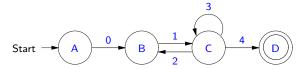

- $Q_N = Q_M \{q\};$
- $s_N = s_M$;
- $A_N = A_M$; and
- $T_N = \mathbf{combineTrans}(simp, U \cup V)$, where
 - $U = \{ p, \alpha \rightarrow r \in T_M \mid p \neq q \text{ and } r \neq q \},$
 - $V = \{ p, simp(\alpha \beta^* \gamma) \rightarrow r \mid p \neq q, r \neq q, p, \alpha \rightarrow q \in T_M \text{ and } q, \gamma \rightarrow r \in T_M \}$, and
 - β is the unique $\alpha \in \mathbf{Reg}$ such that $q, \alpha \to q \in T_M$, if such an α exists, and is %, otherwise.

Suppose *simp* is **locallySimplify obviousSubset**

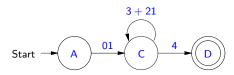

Then **eliminateState** simp(M, B) is

Suppose *simp* is **locallySimplify obviousSubset**

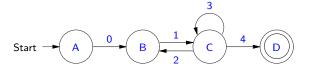

Then **eliminateState** simp(M, B) is

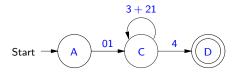

And, we can eliminate C from this RFA, yielding

Suppose *simp* is **locallySimplify obviousSubset**

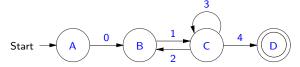

Then **eliminateState** simp(M, B) is

And, we can eliminate C from this RFA, yielding

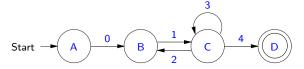

Alternatively, we could eliminate C from

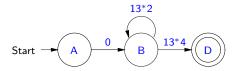

yielding

Alternatively, we could eliminate C from

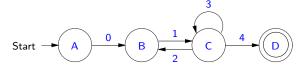

yielding

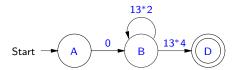

And could then eliminate B from this RFA, yielding

Alternatively, we could eliminate C from

yielding

And could then eliminate B from this RFA, yielding

Start
$$\longrightarrow$$
 A $01(3+21)*4$ D

$$(simp(0(13*2)*(13*4)) = 01(3+21)*4.)$$

Instead of eliminating first C and then B, we could have renamed M's states using the bijection

$$\{(A,A),(B,C),(C,B),(D,D)\}$$

and then have eliminated states in ascending order, according to our usual ordering on symbols: first B and then C.

This is the approach we'll use when looking for alternative answers.

Properties of eliminateState

Proposition 3.12.11

Suppose $simp \in \mathbf{Reg} \to \mathbf{Reg}$, M is an RFA and $q \in Q_M - (\{s_M\} \cup A_M)$.

- (1) eliminateState simp(M, q) has one less state than M.
- (2) If M is standard, then eliminateState simp(M, q) is standard.
- (3) If, for all $\alpha \in \text{Reg}$, $L(\text{simp } \alpha) = L(\alpha)$, then L(eliminateState simp (M, q)) = L(M).
- (4) If, for all $\alpha \in \text{Reg}$, $\text{alphabet}(\text{simp } \alpha) \subseteq \text{alphabet } \alpha$, then $\text{alphabet}(\text{eliminateState simp } (M, q)) \subseteq \text{alphabet } M$.

The RFA module has a function

```
val eliminateState : (reg -> reg) -> rfa * sym -> rfa
that corresponds to eliminateState.
```

Here is how our state-elimination examples can be carried out in Forlan:

```
- val rfa = RFA.input "";
@ {states} A, B, C, D {start state} A
@ {accepting states} D
@ {transitions}
\emptyset A, 0 -> B; B, 1 -> C; C, 2 -> B; C, 3 -> C;
Q C, 4 -> D
Q .
val rfa = - : rfa
- val simp =
        #2 o
        Reg.locallySimplify(NONE, Reg.obviousSubset);
val simp = fn : reg -> reg
- val eliminateState = RFA.eliminateState simp;
val eliminateState = fn : rfa * sym -> rfa
```

```
- val rfa' = eliminateState(rfa, Sym.fromString "B");
val rfa' = - : rfa
- RFA.output("", rfa');
{states} A, C, D {start state} A {accepting states} D
\{transitions\}\ A,\ O1 \rightarrow C;\ C,\ 4 \rightarrow D;\ C,\ 3 + 21 \rightarrow C
val it = () : unit
- val rfa^{,,} =
        eliminateState(rfa', Sym.fromString "C");
val rfa'' = - : rfa
- RFA.output("", rfa'');
{states} A, D {start state} A {accepting states} D
\{transitions\}\ A,\ 01(3 + 21)*4 -> D
val it = () : unit
```

```
- val rfa''' =
        eliminateState(rfa, Sym.fromString "C");
val rfa''' = - : rfa
- RFA.output("", rfa',');
{states} A, B, D {start state} A {accepting states} D
\{transitions\}\ A,\ O \rightarrow B;\ B,\ 13*2 \rightarrow B;\ B,\ 13*4 \rightarrow D
val it = () : unit
- val rfa',',' =
        eliminateState(rfa''', Sym.fromString "B");
val rfa',',' = - : rfa
- RFA.output("", rfa',',');
{states} A, D {start state} A {accepting states} D
\{transitions\}\ A,\ 01(3 + 21)*4 -> D
val it = () : unit
```

And eliminateState stops us from eliminating a start state or an accepting state:

```
- eliminateState(rfa, Sym.fromString "A");
cannot eliminate start state: "A"

uncaught exception Error
- eliminateState(rfa, Sym.fromString "D");
cannot eliminate accepting state: "D"

uncaught exception Error
```

Conversion Algorithm

Now, we use eliminateState to define a function/algorithm

$$\textbf{rfaToReg} \in (\textbf{Reg} \rightarrow \textbf{Reg}) \rightarrow \textbf{RFA} \rightarrow \textbf{Reg}.$$

It takes elements $simp \in \mathbf{Reg} \to \mathbf{Reg}$ and $M \in \mathbf{RFA}$, and returns

$$f$$
(standardize M),

where f is the function from standard RFAs to regular expressions that is defined by well-founded recursion on the number of states of its input, M, as follows:

- If M has only two states, then f returns the label of the transition from s_M to M's accepting state, if such a transition exists, and returns \$, otherwise.
- Otherwise, f calls itself recursively on eliminateState simp(M, q), where q is the least element (in the standard ordering on symbols) of $Q_M (\{s_M\} \cup A_M)$.

Conversion Algorithm

Proposition 3.12.12

Suppose M is an RFA and $simp \in \mathbf{Reg} \to \mathbf{Reg}$ has the property that, for all $\alpha \in \mathbf{Reg}$, $L(simp \alpha) = L(\alpha)$ and $\mathbf{alphabet}(simp \alpha) \subseteq \mathbf{alphabet} \alpha$. Then:

- (1) L(rfaToReg simp M) = L(M); and
- (2) $\operatorname{alphabet}(\operatorname{rfaToReg}\operatorname{simp} M) \subseteq \operatorname{alphabet} M$.

Conversion Algorithm

Finally, we define our RFA to regular expression conversion algorithm/function:

$$\textbf{faToReg} \in (\textbf{Reg} \rightarrow \textbf{Reg}) \rightarrow \textbf{FA} \rightarrow \textbf{Reg}.$$

faToReg takes in $simp \in Reg \rightarrow Reg$, and returns

rfaToReg *simp* ∘ **faToRFA** *simp*.

Proposition 3.12.13

Suppose M is an FA and $simp \in \mathbf{Reg} \to \mathbf{Reg}$ has the property that, for all $\alpha \in \mathbf{Reg}$, $L(simp \alpha) = L(\alpha)$ and $\mathbf{alphabet}(simp \alpha) \subseteq \mathbf{alphabet} \alpha$. Then:

- (1) L(faToReg simp M) = L(M); and
- (2) $\operatorname{alphabet}(\operatorname{faToReg}\operatorname{simp}M)\subseteq\operatorname{alphabet}M.$

The Forlan module RFA includes functions

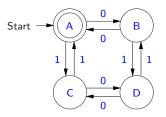

```
val faToReg : (reg -> reg) -> fa -> reg
val faToRegPerms :
    int option * (reg -> reg) -> fa -> reg
val faToRegPermsTrace :
    int option * (reg -> reg) -> fa -> reg
```

which are available in the top-level environment as

```
val faToReg : (reg -> reg) -> fa -> reg
val faToRegPerms :
    int option * (reg -> reg) -> fa -> reg
val faToRegPermsTrace :
    int option * (reg -> reg) -> fa -> reg
```

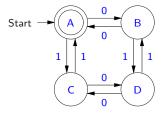

faToRegPerms tries faToReg on a specified number of permutations of the states of an FA, picking the simplest result.

Suppose fa is the FA

which accepts

Suppose fa is the FA

which accepts $\{w \in \{0,1\}^* \mid w \text{ has an even number of 0 and 1's }\}$. Converting fa into a regular expression using faToReg and weaklySimplify yields a fairly complicated answer:

```
- val reg = faToReg Reg.weaklySimplify fa;
val reg = - : reg
- Reg.output("", reg);
% + 00(00)* +
(1 + 00(00)*1)(11 + 100(00)*1)*(1 + 100(00)*) +
(0(00)*1 +
 (1 + 00(00)*1)(11 + 100(00)*1)*(0 + 10(00)*1))
(1(00)*1 +
 (0 + 10(00)*1)(11 + 100(00)*1)*(0 + 10(00)*1))*
(10(00)* +
 (0 + 10(00)*1)(11 + 100(00)*1)*(1 + 100(00)*))
val it = () : unit
```

But by using faToRegPerms, we can do much better:

But by using faToRegPerms, we can do much better:

By using faToRegPermsTrace, we can learn that this answer was found using the renaming

of M's states.

That is, it was found by making M into a standard RFA, with new start and accepting states, and then eliminating the states corresponding to B, C, D and A, in that order.

Regular Languages

Since we have algorithms for converting back and forth between regular expressions and finite automata, as well as algorithms for converting FAs to EFAs, EFAs to NFAs, and NFAs to DFAs, we have the following theorem:

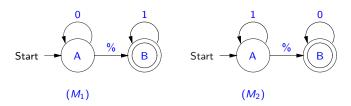

Theorem 3.12.14

Suppose L is a language. The following statements are equivalent:

- L is regular;
- L is generated by a regular expression;
- L is accepted by a finite automaton;
- L is accepted by an EFA;
- L is accepted by an NFA; and
- L is accepted by a DFA.

Intersections of EFAs

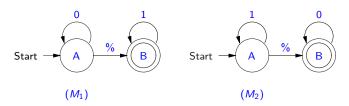

Consider the EFAs M_1 and M_2 :

How can we construct an EFA N such that $L(N) = L(M_1) \cap L(M_2)$?

Intersections of EFAs

Consider the EFAs M_1 and M_2 :

How can we construct an EFA N such that

$$L(N) = L(M_1) \cap L(M_2)?$$

The idea is to make the states of N represent pairs of the form (q,r), where $q \in Q_{M_1}$ and $r \in Q_{M_2}$.

Auxiliary Functions for Intersection

In order to define our intersection operation on EFAs, we first need to define two auxiliary functions. Suppose M_1 and M_2 are EFAs. We define a function

$$\begin{split} \mathbf{nextSym}_{M_1,M_2} &\in (Q_{M_1} \times Q_{M_2}) \times \mathbf{Sym} \to \mathcal{P}(Q_{M_1} \times Q_{M_2}) \\ \mathbf{by} \ \mathbf{nextSym}_{M_1,M_2}((q,r),a) &= \\ & \{ (q',r') \mid q,a \to q' \in \mathcal{T}_{M_1} \ \mathsf{and} \ r,a \to r' \in \mathcal{T}_{M_2} \}. \end{split}$$

Auxiliary Functions for Intersection

In order to define our intersection operation on EFAs, we first need to define two auxiliary functions. Suppose M_1 and M_2 are EFAs. We define a function

$$\begin{split} \mathsf{nextSym}_{M_1,M_2} &\in (Q_{M_1} \times Q_{M_2}) \times \mathsf{Sym} \to \mathcal{P}(Q_{M_1} \times Q_{M_2}) \\ \mathsf{by} \ \ \mathsf{nextSym}_{M_1,M_2}((q,r),a) &= \\ & \{ \, (q',r') \mid q,a \to q' \in T_{M_1} \ \mathsf{and} \ r,a \to r' \in T_{M_2} \, \}. \end{split}$$

- nextSym((A, A), 0) =
- **nextSym**((A, B), 0) =

Auxiliary Functions for Intersection

In order to define our intersection operation on EFAs, we first need to define two auxiliary functions. Suppose M_1 and M_2 are EFAs. We define a function

$$\begin{split} \mathbf{nextSym}_{M_1,M_2} &\in (Q_{M_1} \times Q_{M_2}) \times \mathbf{Sym} \to \mathcal{P}(Q_{M_1} \times Q_{M_2}) \\ \mathbf{by} \ \mathbf{nextSym}_{M_1,M_2}((q,r),a) &= \\ & \{ (q',r') \mid q,a \to q' \in T_{M_1} \ \mathsf{and} \ r,a \to r' \in T_{M_2} \, \}. \end{split}$$

- $nextSym((A, A), 0) = \emptyset$; and
- $nextSym((A, B), 0) = \{(A, B)\}.$

Suppose M_1 and M_2 are EFAs. We define a function

$$\textbf{nextEmp}_{M_1,M_2} \in (\textit{Q}_{M_1} \times \textit{Q}_{M_2}) \rightarrow \mathcal{P}(\textit{Q}_{M_1} \times \textit{Q}_{M_2})$$

by
$$\mathbf{nextEmp}_{M_1,M_2}(q,r) =$$

$$\{(q',r) \mid q,\% \to q' \in T_{M_1}\} \cup \{(q,r') \mid r,\% \to r' \in T_{M_2}\}.$$

Suppose M_1 and M_2 are EFAs. We define a function

$$\mathsf{nextEmp}_{M_1,M_2} \in (\mathit{Q}_{M_1} \times \mathit{Q}_{M_2}) \mathop{\rightarrow} \mathcal{P}(\mathit{Q}_{M_1} \times \mathit{Q}_{M_2})$$

by
$$\mathsf{nextEmp}_{M_1,M_2}(q,r) = \{ (q',r) \mid q,\% \to q' \in \mathcal{T}_{M_1} \} \cup \{ (q,r') \mid r,\% \to r' \in \mathcal{T}_{M_2} \}.$$

- nextEmp(A, A) =
- nextEmp(A, B) =
- **nextEmp**(B, A) =
- **nextEmp**(B, B) =

Suppose M_1 and M_2 are EFAs. We define a function

$$\mathsf{nextEmp}_{M_1,M_2} \in (\mathit{Q}_{M_1} \times \mathit{Q}_{M_2}) \mathop{\rightarrow} \mathcal{P}(\mathit{Q}_{M_1} \times \mathit{Q}_{M_2})$$

by
$$\mathsf{nextEmp}_{M_1,M_2}(q,r) = \{ (q',r) \mid q,\% \to q' \in \mathcal{T}_{M_1} \} \cup \{ (q,r') \mid r,\% \to r' \in \mathcal{T}_{M_2} \}.$$

- $nextEmp(A, A) = \{(B, A), (A, B)\};$
- nextEmp(A, B) =
- **nextEmp**(B, A) =
- **nextEmp**(B, B) =

Suppose M_1 and M_2 are EFAs. We define a function

$$\mathsf{nextEmp}_{M_1,M_2} \in (\mathit{Q}_{M_1} \times \mathit{Q}_{M_2}) \mathop{\rightarrow} \mathcal{P}(\mathit{Q}_{M_1} \times \mathit{Q}_{M_2})$$

by
$$\mathbf{nextEmp}_{M_1,M_2}(q,r) =$$

$$\{(q',r) \mid q,\% \to q' \in T_{M_1}\} \cup \{(q,r') \mid r,\% \to r' \in T_{M_2}\}.$$

- nextEmp(A, A) = {(B, A), (A, B)};
- nextEmp(A, B) = {(B, B)};
- nextEmp(B, A) =
- **nextEmp**(B, B) =

Suppose M_1 and M_2 are EFAs. We define a function

$$\mathsf{nextEmp}_{M_1,M_2} \in (\mathit{Q}_{M_1} \times \mathit{Q}_{M_2}) \to \mathcal{P}(\mathit{Q}_{M_1} \times \mathit{Q}_{M_2})$$

by
$$\mathsf{nextEmp}_{M_1,M_2}(q,r) = \{ (q',r) \mid q,\% \to q' \in \mathcal{T}_{M_1} \} \cup \{ (q,r') \mid r,\% \to r' \in \mathcal{T}_{M_2} \}.$$

- $nextEmp(A, A) = \{(B, A), (A, B)\};$
- nextEmp(A, B) = {(B, B)};
- $nextEmp(B, A) = \{(B, B)\}$; and
- **nextEmp**(B, B) =

Suppose M_1 and M_2 are EFAs. We define a function

$$\mathsf{nextEmp}_{M_1,M_2} \in (\mathit{Q}_{M_1} \times \mathit{Q}_{M_2}) \mathop{
ightarrow} \mathcal{P}(\mathit{Q}_{M_1} \times \mathit{Q}_{M_2})$$

by
$$\mathbf{nextEmp}_{M_1,M_2}(q,r) =$$

$$\{(q',r) \mid q,\% \to q' \in T_{M_1}\} \cup \{(q,r') \mid r,\% \to r' \in T_{M_2}\}.$$

- $nextEmp(A, A) = \{(B, A), (A, B)\};$
- nextEmp(A, B) = {(B, B)};
- $nextEmp(B, A) = \{(B, B)\}$; and
- $nextEmp(B, B) = \emptyset$.

Now, we define a function/algorithm **inter** \in **EFA** \times **EFA** \to **EFA** such that $L(\operatorname{inter}(M_1, M_2)) = L(M_1) \cap L(M_2)$, for all $M_1, M_2 \in \text{EFA}$. Given EFAs M_1 and M_2 , $\operatorname{inter}(M_1, M_2)$ is the EFA N that is constructed as follows.

Now, we define a function/algorithm **inter** \in **EFA** \times **EFA** \to **EFA** such that $L(\operatorname{inter}(M_1, M_2)) = L(M_1) \cap L(M_2)$, for all $M_1, M_2 \in \operatorname{EFA}$. Given EFAs M_1 and M_2 , $\operatorname{inter}(M_1, M_2)$ is the EFA N that is constructed as follows.

First, we let $\Sigma =$ alphabet $M_1 \cap$ alphabet M_2 .

Now, we define a function/algorithm $\mathbf{inter} \in \mathbf{EFA} \times \mathbf{EFA} \to \mathbf{EFA}$ such that $L(\mathbf{inter}(M_1, M_2)) = L(M_1) \cap L(M_2)$, for all $M_1, M_2 \in \mathbf{EFA}$. Given EFAs M_1 and M_2 , $\mathbf{inter}(M_1, M_2)$ is the EFA N that is constructed as follows.

First, we let $\Sigma =$ alphabet $M_1 \cap$ alphabet M_2 .

Next, we generate the least subset X of $Q_{M_1} \times Q_{M_2}$ such that

- $(s_{M_1}, s_{M_2}) \in X$;
- for all $q \in Q_{M_1}$, $r \in Q_{M_2}$ and $a \in \Sigma$, if $(q, r) \in X$, then $\mathbf{nextSym}((q, r), a) \subseteq X$; and
- for all $q \in Q_{M_1}$ and $r \in Q_{M_2}$, if $(q, r) \in X$, then $\mathbf{nextEmp}(q, r) \subseteq X$.

- $Q_N =$
- *s*_N =
- \bullet $A_N =$
- *T_N* =

- $Q_N = \{ \langle q, r \rangle \mid (q, r) \in X \};$
- *s*_N =
- \bullet $A_N =$
- $T_N =$

- $Q_N = \{ \langle q, r \rangle \mid (q, r) \in X \};$
- $s_N = \langle s_{M_1}, s_{M_2} \rangle$;
- \bullet $A_N =$
- $T_N =$

- $Q_N = \{ \langle q, r \rangle \mid (q, r) \in X \};$
- $s_N = \langle s_{M_1}, s_{M_2} \rangle$;
- $A_N = \{ \langle q, r \rangle \mid (q, r) \in X \text{ and } q \in A_{M_1} \text{ and } r \in A_{M_2} \}$; and
- $T_N =$

- $Q_N = \{ \langle q, r \rangle \mid (q, r) \in X \};$
- $s_N = \langle s_{M_1}, s_{M_2} \rangle$;
- $A_N = \{ \langle q, r \rangle \mid (q, r) \in X \text{ and } q \in A_{M_1} \text{ and } r \in A_{M_2} \}$; and
- \bullet $T_N =$

$$\{\langle q,r \rangle, a \to \langle q',r' \rangle \mid (q,r) \in X \text{ and } a \in \Sigma \text{ and}$$

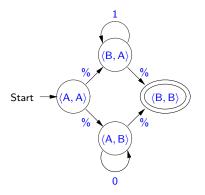

$$(q',r') \in \mathbf{nextSym}((q,r),a)\}$$

$$\cup \{\langle q,r \rangle, \% \to \langle q',r' \rangle \mid (q,r) \in X \text{ and}$$

$$(q',r') \in \mathbf{nextEmp}(q,r)\}.$$

Intersection Example

Suppose M_1 and M_2 are our example EFAs. Then $inter(M_1, M_2)$ is

Theorem 3.12.15

For all $M_1, M_2 \in \mathbf{EFA}$:

- $L(inter(M_1, M_2)) = L(M_1) \cap L(M_2)$; and
- alphabet(inter(M_1, M_2)) \subseteq alphabet $M_1 \cap$ alphabet M_2 .

Theorem 3.12.15

For all $M_1, M_2 \in \mathbf{EFA}$:

- $L(inter(M_1, M_2)) = L(M_1) \cap L(M_2)$; and
- alphabet(inter(M_1, M_2)) \subseteq alphabet $M_1 \cap$ alphabet M_2 .

Proposition 3.12.16

For all $M_1, M_2 \in NFA$, inter $(M_1, M_2) \in NFA$.

Theorem 3.12.15

For all $M_1, M_2 \in \mathbf{EFA}$:

- $L(inter(M_1, M_2)) = L(M_1) \cap L(M_2)$; and
- alphabet(inter(M_1, M_2)) \subseteq alphabet $M_1 \cap$ alphabet M_2 .

Proposition 3.12.16

For all $M_1, M_2 \in NFA$, inter $(M_1, M_2) \in NFA$.

Proposition 3.12.17

For all $M_1, M_2 \in \mathbf{DFA}$:

- (1) $inter(M_1, M_2) \in DFA$; and
- (2) $alphabet(inter(M_1, M_2)) = alphabet M_1 \cap alphabet M_2$.

Next, we define a function **complement** \in **DFA** \times **Alp** \rightarrow **DFA** such that, for all $M \in$ **DFA** and $\Sigma \in$ **Alp**,

$$L(\mathbf{complement}(M, \Sigma)) = (\mathbf{alphabet}(L(M)) \cup \Sigma)^* - L(M).$$

Next, we define a function **complement** \in **DFA** \times **Alp** \rightarrow **DFA** such that, for all $M \in$ **DFA** and $\Sigma \in$ **Alp**,

$$L(\mathbf{complement}(M, \Sigma)) = (\mathbf{alphabet}(L(M)) \cup \Sigma)^* - L(M).$$

In the common case when $L(M) \subseteq \Sigma^*$, we will have that $\mathbf{alphabet}(L(M)) \subseteq \Sigma$, and thus that $(\mathbf{alphabet}(L(M)) \cup \Sigma)^* = \Sigma^*$. Hence, it will be the case that

$$L(\mathbf{complement}(M, \Sigma)) = \Sigma^* - L(M).$$

Given a DFA M and an alphabet Σ , **complement** (M, Σ) is the DFA N that is produced as follows. First, we let the DFA $M' = \mathbf{determSimplify}(M, \Sigma)$. Thus:

- M' is equivalent to M; and
- alphabet $M' = \text{alphabet}(L(M)) \cup \Sigma$.

Then, we define N by:

- \bullet $Q_N =$
- *s*_N =
- \bullet $A_N =$
- $T_N =$

Given a DFA M and an alphabet Σ , **complement** (M, Σ) is the DFA N that is produced as follows. First, we let the DFA $M' = \mathbf{determSimplify}(M, \Sigma)$. Thus:

- M' is equivalent to M; and
- alphabet $M' = \text{alphabet}(L(M)) \cup \Sigma$.

Then, we define N by:

- $Q_N = Q_{M'}$;
- $s_N = s_{M'}$;
- \bullet $A_N =$
- $T_N = T_{M'}$.

Given a DFA M and an alphabet Σ , **complement** (M, Σ) is the DFA N that is produced as follows. First, we let the DFA $M' = \mathbf{determSimplify}(M, \Sigma)$. Thus:

- M' is equivalent to M; and
- alphabet $M' = \text{alphabet}(L(M)) \cup \Sigma$.

Then, we define N by:

- $Q_N = Q_{M'}$;
- $s_N = s_{M'}$;
- $A_N = Q_{M'} A_{M'}$; and
- $\bullet \ T_{N}=T_{M'}.$

```
Then, for all w \in (\mathbf{alphabet}\ M')^* = (\mathbf{alphabet}\ N)^* = (\mathbf{alphabet}(L(M)) \cup \Sigma)^*, w \in L(N) iff \delta_N(s_N, w) \in A_N iff \delta_N(s_N, w) \in Q_{M'} - A_{M'} iff \delta_{M'}(s_{M'}, w) \not\in A_{M'} iff w \not\in L(M') iff w \not\in L(M).
```

```
Then, for all
w \in (alphabet M')^* = (alphabet N)^* = (alphabet(L(M)) \cup \Sigma)^*,
                 w \in L(N) iff \delta_N(s_N, w) \in A_N
                                iff \delta_N(s_N, w) \in Q_{M'} - A_{M'}
                                iff \delta_{M'}(s_{M'}, w) \notin A_{M'}
                                iff w \notin L(M')
                                iff w \notin L(M).
```

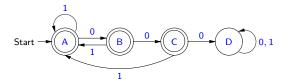

Hence:

Theorem 3.12.18

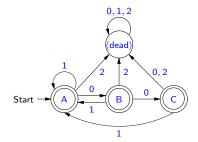

For all $M \in \mathbf{DFA}$ and $\Sigma \in \mathbf{Alp}$:

- $L(\text{complement}(M, \Sigma)) = (\text{alphabet}(L(M)) \cup \Sigma)^* L(M);$ and
- alphabet(complement(M, Σ)) = alphabet(L(M)) $\cup \Sigma$.

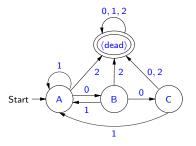

For example, suppose the DFA M is

Then **determSimplify** $(M, \{2\})$ is the DFA

Thus **complement** $(M, \{2\})$ is

Let $X = \{ w \in \{0,1\}^* \mid 000 \text{ is not a substring of } w \}$. Then $L(\mathbf{complement}(M,\{2\}))$ is

```
(alphabet(L(M)) \cup \{2\})^* - L(M)
= (\{0,1\} \cup \{2\})^* - X
= \{ w \in \{0,1,2\}^* \mid w \notin X \}
= \{ w \in \{0,1,2\}^* \mid
```

```
Let X = \{ w \in \{0, 1\}^* \mid 000 \text{ is not a substring of } w \}. Then L(\mathbf{complement}(M, \{2\})) is  (\mathbf{alphabet}(L(M)) \cup \{2\})^* - L(M)  = (\{0, 1\} \cup \{2\})^* - X  = \{ w \in \{0, 1, 2\}^* \mid w \notin X \}  = \{ w \in \{0, 1, 2\}^* \mid 2 \in \mathbf{alphabet} \ w \text{ or } 000 \text{ is a substring of } w \}.
```

We define a function/algorithm $minus \in DFA \times DFA \rightarrow DFA$ by:

$$minus(M_1, M_2) =$$

We define a function/algorithm **minus** \in **DFA** \times **DFA** by:

$$minus(M_1, M_2) = inter(M_1, complement(M_2, \dots)).$$

We define a function/algorithm **minus** \in **DFA** \times **DFA** by:

 $minus(M_1, M_2) = inter(M_1, complement(M_2, alphabet M_1)).$

Theorem 3.12.19

For all $M_1, M_2 \in \mathbf{DFA}$:

- $L(\min(M_1, M_2)) = L(M_1) L(M_2)$; and
- alphabet(minus(M_1, M_2)) = alphabet M_1 .

Set Difference of DFAs

Theorem 3.12.19

For all $M_1, M_2 \in \mathbf{DFA}$:

- $L(\min(M_1, M_2)) = L(M_1) L(M_2)$; and
- alphabet(minus(M_1, M_2)) = alphabet M_1 .

Proof.

```
w \in L(\mathbf{minus}(M_1, M_2))
iff w \in L(\mathbf{inter}(M_1, \mathbf{complement}(M_2, \mathbf{alphabet}\ M_1)))
iff w \in L(M_1) and w \in L(\mathbf{complement}(M_2, \mathbf{alphabet}\ M_1))
iff w \in L(M_1) and w \in (\mathbf{alphabet}(L(M_2)) \cup \mathbf{alphabet}\ M_1)^* and w \not\in L(M_2)
iff w \in L(M_1) and w \not\in L(M_2)
iff w \in L(M_1) - L(M_2).
```

Summary of Closure Properties

Theorem 3.12.28

Suppose $L, L_1, L_2 \in \mathbf{RegLan}$. Then:

- $L_1 \cup L_2 \in \mathbf{RegLan}$ (because of the operation union on FAs);
- $L_1L_2 \in \mathbf{RegLan}$ (because of the operation concat on FAs);
- L* ∈ RegLan (because of the operation closure on FAs);
- $L_1 \cap L_2 \in \mathbf{RegLan}$ (because of the operation inter on EFAs); and
- $L_1 L_2 \in \mathbf{RegLan}$ (because of the operation minus on DFAs).

The book shows several additional closure properties of regular languages.

Intersections, Complementations and Differences in Forlan

The Forlan module EFA defines the function/algorithm

```
val inter : efa * efa -> efa
```

which corresponds to **inter**. It is also inherited by the modules DFA and NFA.

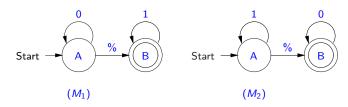

The Forlan module DFA defines the functions

```
val complement : dfa * sym set -> dfa
val minus : dfa * dfa -> dfa
```

which correspond to **complement** and **minus**.

The book shows how several other operations on automata and regular expressions can be used in Forlan.

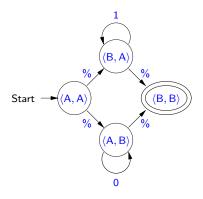

Suppose the identifiers efa1 and efa2 of type efa are bound to our example EFAs M_1 and M_2 :

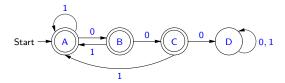

Then, we can construct $inter(M_1, M_2)$ as follows:

```
- val efa = EFA.inter(efa1, efa2);
val efa = - : efa
- EFA.output("", efa);
{states} <A,A>, <A,B>, <B,A>, <B,B>
{start state} <A,A> {accepting states} <B,B>
{transitions}
<A,A>, % -> <A,B> | <B,A>; <A,B>, % -> <B,B>;
<A,B>, 0 -> <A,B>; <B,A>, % -> <B,B>;
<B,A>, 1 -> <B,A>
val it = () : unit
```

Thus efa is bound to the EFA

Suppose dfa is bound to our example DFA M

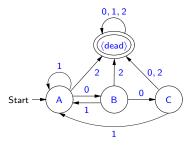

Then we can construct the DFA **complement**(M, {2}) as follows:

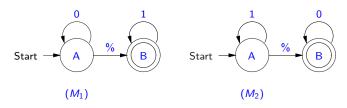

```
- val dfa' = DFA.complement(dfa, SymSet.input "");
@ 2
@ .
val dfa' = - : dfa
```

```
- DFA.output("", dfa');
{states} A, B, C, <dead> {start state} A
{accepting states} <dead>
{transitions}
A, 0 -> B; A, 1 -> A; A, 2 -> <dead>; B, 0 -> C;
B, 1 -> A; B, 2 -> <dead>; C, 0 -> <dead>; C, 1 -> A;
C, 2 -> <dead>; <dead>, 0 -> <dead>;
<dead>, 1 -> <dead>;
<dead>, 1 -> <dead>;
<dead>, 2 -> <dead>
val it = () : unit
```

Thus dfa' is bound to the DFA

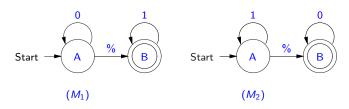

Suppose the identifiers efa1 and efa2 of type efa are bound to our example EFAs M_1 and M_2 :

We can construct an EFA that accepts $L(M_1) - L(M_2)$ as follows:

Suppose the identifiers efa1 and efa2 of type efa are bound to our example EFAs M_1 and M_2 :

We can construct an EFA that accepts $L(M_1) - L(M_2)$ as follows:

```
- val dfa1 = nfaToDFA(efaToNFA efa1);
val dfa1 = - : dfa
- val dfa2 = nfaToDFA(efaToNFA efa2);
val dfa2 = - : dfa
- val dfa = DFA.minus(dfa1, dfa2);
val dfa = - : dfa
```

```
- val efa = injDFAToEFA dfa;
val efa = - : efa
- EFA.accepted efa (Str.input "");
@ 01
@ .
val it = true : bool
- EFA.accepted efa (Str.input "");
@ 0
@ .
val it = false : bool
```
